- 4 Application 2: Characterization of transport properties of porous materials from digital images

# Why

- Geo materials characterization
  - are Time consuming
  - require specific and costly equipment
  - not always possible
- Need agile tools for
  - Low carbon materials design such as **co<sub>2</sub> friendly concrete**
  - Carbon storage materials design
- Traditional simulations tools
  - are time consuming
  - may include empirical formulas
  - are difficult to resolve at pore scale

# Potential of the method

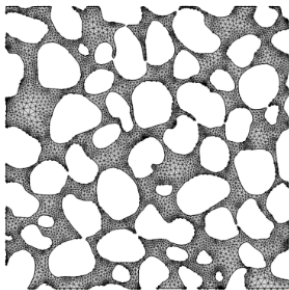

## Potential applications of pore network modeling

- Material characterization
  - Relative diffusivity and permeability
  - Absolute permeability
  - Effective diffusivity and tortuosity
  - Desorption isotherm
- Geo materials design
  - concrete
  - ceramics
  - fibers composites

# Continuum vs. PNM modeling

(a) FEM mesh

(b) Equivalent PNM

Figure: FEM vs. PNM

# Continuum vs. PNM modeling

## Continuum modeling

- Mathematically rigorous, but practical limitations
- Requires experimentally measured constitutive relationships
- Discrete pore-scale phenomena not resolved
- Distribution of phases within the continuum not often well predicted
- Not appropriate for thin materials

## Pore Network modeling

- Transport inside the network is modeled using finite difference schemes to solve 1D analytical solutions of the relevant transport equations.
- PNMs can predict constitutive relationships for experimentally inaccessible multiphase parameters.
- PNMs Include interaction between the structure and flow characteristics included

# PNM concept

- Sizes and connectivity of the pores and throats are chosen to match the known physical structure

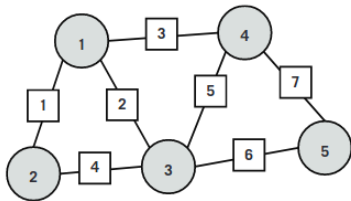

Figure: Network of pores and throats Gostick et al. (2016)

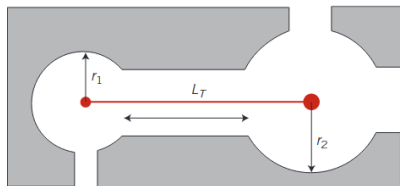

Figure: PNM unit Gostick et al. (2016)

- Structural properties of the porous material can be readily obtained from various imaging techniques

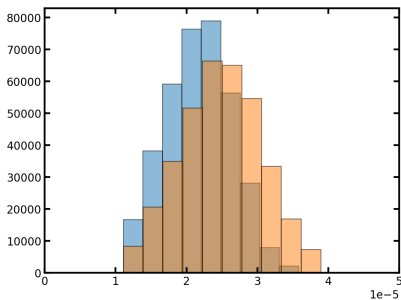

# How the network properties can be obtained ?

- Key structural properties are
  - Size of throats and pores
  - Pores and throat connectivity
- Can be obtained :
  - from imaging techniques
  - from computer generated structures
  - by adjusting pores and throat size to allow the model to reproduce experimental known properties

# Relative transport properties

## Challenges

Well known methods need:

- Empirical formulas to account for dependence of diffusivity and permeability to saturation
- A lot of parameters to calibrate, not always easy
- Require experimental data not always available

# Relative transport properties

## Opportunities

PNMs allows:

- Direct simulation of transport properties :
  - absolute permeability
  - effective diffusivity and and tortuosity
  - relative permeability
  - relative diffusivity
- sensitivity study:
  - fluid temperature
  - fluid viscosity
  - material porosity
